Exponential Functions

Pacing: _____
(week/section/date)

SO YOU THINK YOU KNOW WHAT?

Understanding exponential functions is very important in many fields of science.

Figure 1. A 2D grayscale image showing a noisy pattern of black and white pixels. The image is 1000 pixels wide and 1000 pixels high. A color bar at the bottom right indicates the grayscale intensity from 0 to 255.

growth/decay, pH, P_{CO_2} , etc. In calculus, you will learn how to calculate rates of change.

For more information about the study, contact Dr. Michael J. Hwang at (319) 335-1111 or email at mhwang@uiowa.edu.

Figure 1. A schematic diagram of the experimental setup. The light source (laser) emits a beam that passes through a lens and a polarizer. The beam is focused onto a sample stage, which holds a sample and a reference mirror. The reflected light from the sample and the reference mirror is collected by a lens and focused onto a photodetector. The photodetector is connected to a lock-in amplifier, which is connected to a computer.

Figure 1. A schematic diagram of the experimental setup. The laser beam (blue arrow) passes through a lens (lens 1) and a beam splitter (BS). The BS reflects the beam onto a mirror (M) and focuses it onto a sample (S). The sample is placed on a stage (Stage) with a piezoelectric transducer (PZT). The reflected beam is collected by a lens (lens 2) and focused onto a photomultiplier tube (PMT).

Exponential Functions

3/4

$E^x \cdot E^y = E^{x+y}$

Exponential functions can be used to model many real world phenomena. These models can then be used to help us answer questions in areas such as finance (compounding interest), infectious disease (pandemics), population growth and decay, and many other areas that impact our daily lives. STEM fields such as chemistry and biology use models that rely on exponential functions and their inverses, logarithmic functions. A solid understanding of the properties of exponentials will prepare you for further analysis in calculus.

$E^x / E^y = E^{x-y}$

[Written Homework- Exponential Functions](#)

[Activity - Exponential Functions](#)

[Activity - Exponent Rules and Computations](#)

{ > $E^x \cdot E^y = E^{x+y}$

Use rules of exponents to rewrite exponential expressions in equivalent forms.

Define exponential functions and identify exponential and non-exponential functions by applying the definition.

Determine the limits as $x \rightarrow \pm\infty$ (end behavior) of exponential functions.

Justify through analysis of the base and/or by sketching a graph.

Describe how graphs of exponential functions vary for different values of the base.

Define horizontal asymptote using limits and identify horizontal asymptotes of exponential functions.

Recognize and be able to produce the graphs of non-transformed exponential functions.

{ > Á %f%X ~ Px/ ~ ‡ >É

Logarithmic Functions

3/4

\hat{E}^{\wedge} \div \wedge \times

The importance of exponentials in STEM (and beyond) means that the inverses of exponentials are also very useful. The inverse of an exponential is a logarithm! Understanding how to use exponentials to model something like bacteria growth, means also understanding how to use logarithms. A good foundation in how to use and manipulate logarithms will be helpful as we try to solve problems that involve exponentials.

$\Delta > \hat{E}^{\wedge} \neq \Delta / > \hat{E}$

[Activity - Graphs of Logarithmic Functions](#)

[Activity - How do logs work?](#)

{ > $\Delta \% \neq X^{\wedge} \neq \Delta \times / \wedge \neq \Delta \neq \hat{E}$

Define logarithmic functions as inverses of exponential functions.

Use the definition and basic properties of logarithms to convert between logarithmic and exponential expressions.

Recognize and be able to graph non-transformed and transformed logarithmic functions.

Describe how graphs of logarithmic functions vary for different values of b (the base).

Determine the limits (end behavior) of logarithmic functions.

Define one-sided limits, recognize one-sided limit notation, and use the notation appropriately.

Identify vertical asymptotes of logarithmic functions.

E^{\sim} \div \wedge \times

This topic combines ideas about exponential, logarithmic, and inverse functions in the context of solving equations. Exponential and logarithmic equations can be used to model growth and decay of bacteria, measure and compare strength of earthquakes, and other applications. For the first time, students have to choose the most appropriate solution method for the problem in front of them. We develop intuition about how to select strategies by trying things and seeing whether or not they work. Students learn to use the concept of inverse functions to manipulate equations into a form that's easier to work with, and then check

É ~ ÷ ` ×

We use trig graphs to model periodic behavior, for example modeling heart beats, the behavior of planets, or sound/electricity/light waves. The graphs of trig functions offer us an alternate way of seeing the relationship between angles and lengths.

{ > Á % f% X ~ þ x / ~ ‡ > É

Use the unit circle to explain the behavior of the sine and cosine as functions of the real numbers. Make connections between the unit circle and domain/range and intercepts of these functions.

Recognize and be able to produce the graphs of $y = \sin(x)$ and $y = \cos(x)$. Use the graphs to find the period of each function. Also, recognize transformed versions of these graphs using the transformations presented earlier this semester.

Use the sine and cosine functions to explain the behavior of tangent as a function of the real numbers.

Use zeros of the sine and cosine functions to explain the domain and intercepts of the tangent function.

Use one-sided limits to determine the limits of the tangent function at the points of discontinuity in the domain.

É ~ ÷ ` ×
